| Box 3.1 | The Child Cohort Studies | 48 |
| Box 4.1 | Measures of Cognitive Development in the Four Countries | 68 |
| Box 4.2 | Policy Provisions for Parental Leave and Child Care and Early Education in the Four Countries | 81 |
| Box 5.1 | Estimates of Variation Between Versus Within Schools | 89 |
| Box 5.2 | Measures of Achievement in the Four Countries | 93 |
| Box 6.1 | Addressing Measurement Error | 115 |
| Box 7.1 | Cross-National Results for Teens and Adults Also Point to Greater Inequality in the United States | 133 |
| Figure 1.1 | Inequality in language/reading skills at ages four and five is greater in the United States than in other comparable countries. | 13 |
| Figure 1.2 | Average reading scores of U.S. children from different SES groups—and the gaps between them—change relatively little between kindergarten and eighth grade. | 15 |
| Figure 1.3 | Over time, achievement gaps emerge between low- and high-SES children who start school with the same level of reading ability—high-SES children always develop an advantage, whether they start with high, average, or low ability in kindergarten. | 16 |
Figure 2.1 Proficiency in mathematics fades as family background becomes less advantageous: children from the highest-status families are much more likely to master mathematics skills than those from the lowest-status families. 23

Figure 2.2 Proficiency in reading skills also fades as family background becomes less advantageous: children from the highest-status families are much more likely to master reading skills than those from the lowest-status families. 24

Figure 2.3 Inequality of opportunity in mathematics skills at age fourteen is indicated by the gap in test scores for equally ranked individuals across socioeconomic groups. 30

Figure 2.4 Inequality of opportunity in reading skills at age fourteen is indicated by the gap in test scores for equally ranked individuals across socioeconomic groups. 31

Figure 2.5 Inequality of opportunity in mathematics skills at ages five and fourteen is indicated by the gap in test scores for equally ranked individuals across socioeconomic groups. 34

Figure 2.6 Inequality of opportunity in reading skills at ages five and fourteen is indicated by the gap in test scores for equally ranked individuals across socioeconomic groups. 35

Figure 3.1 Children whose parents have a high school education or less are the largest group in the United States. This is also the case in the United Kingdom and Australia, but not in Canada, where parents with at least some postsecondary education make up the largest group. 51

Figure 3.2 Over one in five children in U.S. families with low-educated parents were born to a teen mother, but only three in one hundred in high-educated households. 52

Figure 3.3 Children in the United States are the least likely to be living with both biological parents. 53
Figure 3.4  Although all four countries have many immigrant parents, in the United States children of the least-educated parents are the most likely to have an immigrant parent; because of selective immigration policies, the reverse is true in Australia and Canada. 55

Figure 3.5  In the United States children are more than four times as likely to be living with a mother in poor or fair health in households with low education compared to those living in high-educated households. Though the U.K. story is similar, this gradient is not at all as strong in Australia and Canada. 56

Figure 3.6  Highly educated parents are much more likely to read to their children every day. However, Canadian parents with low education read to their children as often as highly educated parents from the other three countries. 58

Figure 3.7  Incomes of high-educated families in the United States are 1.8 times as large as in middle-educated families and three times as large as in low-educated families. Income differentials are markedly smaller in the United Kingdom and Canada, and particularly in Australia. 60

Figure 3.8  In the absence of government taxes and transfers, child poverty would be as high in the other countries as it is in the United States. However, government benefits do more to reduce poverty in the other countries than they do in the United States. 63

Figure 4.1  Gaps in language and reading skills at age five, by parental education, are largest in the United States. 71

Figure 4.2  Gaps in social and emotional development at age five are largest in the United Kingdom, but in each country are smaller than gaps in cognitive development. 73

Figure 4.3  Gaps in health at age five are largest in the United States and the United Kingdom. 74
Figure 4.4  U.S. families face a “middle-class squeeze,” with medium-SES mothers working the longest hours but having a lower share of children in preschool than high-SES mothers.

Figure 5.1  Achievement gaps by parental education are largest in the United States.

Figure 5.2  Primary school children in the United States watch more television than children in other countries, and this is most marked among those of lower socioeconomic status.

Figure 5.3  Low-SES children in the United States are more likely to have a novice teacher than their higher-SES peers, and the differential is greater than in other countries.

Figure 5.4  Rates of grade repetition are much higher in the United States than elsewhere and are noticeably greater among low-SES children.

Figure 6.1  Average reading scores of children from different SES groups—and the gaps between them—change relatively little between kindergarten and eighth grade.

Figure 6.2  Children with very high reading scores in kindergarten tend on average to “regress to the mean”—to fall back slightly—by eighth grade. Conversely, children with very low scores in kindergarten tend to improve their relative position over the period.

Figure 6.3  Only 60 percent of the SES reading gap we observe in eighth grade can be attributed to differences in ability present in kindergarten: 40 percent is due to the fact that children from different SES groups do not follow common trajectories after kindergarten.

Figure 6.4  Over time, achievement gaps emerge between low- and high-SES children who started school with the same level of reading ability. High-SES children always develop an advantage, whether they started with high, average, or low ability in kindergarten.
Figure 6.5  Diverging trajectories are found in math as well as reading. Low-SES children who start school with average or advanced math skills do not progress at the same pace as their high-SES counterparts.  124

Figure 7.1  Salaries for primary school teachers are above the salaries of comparably educated workers in Canada and nearly on par in the United Kingdom and Australia, but they are seriously behind in the United States.  147

Table 3.1  Employment and weekly hours of work for parents of four- and five-year-olds vary by SES in all four countries  61

Table 4.1  SES gaps in language and reading skills and mathematics skills at age five are largest in the United States  72

Table 4.2  SES gaps in social and emotional development at age five are generally smaller than the SES gaps in cognitive development  76

Table 5.1  SES achievement gaps at age five are largest in the United States  97

Table 5.2  SES achievement gaps at age seven/nine are also largest in the United States  98

Table 5.3  SES achievement gaps at age eleven are also largest in the United States  99

Table 6.1  Many children change their position in the distribution of reading scores between kindergarten and eighth grade: almost half of the lowest achievers early on escape the bottom quartile over the period, and a similar proportion of the highest early achievers drop out of the top quartile by eighth grade.  117

Table 6.2  The United States is not alone in seeing divergence by SES among children who had the same ability levels earlier in childhood. SES-group differences in initial achievement are very important in all three countries, but they cannot account fully for the gaps we observe in reading at age eleven.  128
